ABSTRACT: The gene encoding the 35-kDa protein (35K gene) located within the EcoRI-S genome fragment of Autographa californica **nuclear** ***polyhedrosis*** virus (AcMNPV) is transcribed early in infection. To

examine its function(s) with respect to virus multiplication, we introduced specific mutations of this early gene into the AcMNPV genome. In Spodoptera frugiperda (SF21) culture, deletion of the 35K gene reduced yields of extracellular, budded virus from 200- to 15,000-fold, depending on input multiplicity. Mutant replication was characterized by dramatically diminished levels of late and very late (occlusion-specific) virus gene expression and premature cell ***lysis***. In contrast, 35K gene inactivation had no effect on virus growth in cultured Trichoplusia ni (TN368) cells. Insertion of the 35K gene and its promoter at an alternate site (polyhedrin locus) restored virus replication to wild-type levels in SF21 culture. Subsequent insertion of 4 bp after codon 81 generated a frameshift mutant that exhibited a virus phenotype indistinguishable from that of 35K deletion mutants and demonstrated that the 35K gene product (p35) was required for wild-type replication in SF21 cells. Mutagenesis also indicated that the C terminus of ***p35***, including the last 12 residues, was required for function. In complementation assays, wild-type virus bearing a functional 35K gene

allele stimulated all aspects of 35K null mutant replication and suppressed early cell ***lysis***. These findings indicated that p35 is a trans-dominant factor that facilitates AcMNPV growth in a cell line-specific manner.

Abstract: We have constructed several plasmid expression vectors to express foreign genes in stably transformed insect cells. Unlike **baculovirus**-based expression vectors by which genes of interest are expressed transiently before **lysis** of virus virus-infected cells, genes can be expressed continuously over many passages in a stable cell line. Furthermore, the function of a gene or genes expressed in a stable cell line from an insect-specific promoter that is constitutively expressed can be studied in the absence of virus infection and viral gene expression. In this study, we have expressed a novel, selectable marker gene, puromycin acetyltransferase, under the control of the *Drosophila melanogaster* hsp70 promoter or under the control of the AcMNPV ie-1 promoter which is active in *Spodoptera frugiperda* cells in the absence of virus infection. In addition, we have constructed expression vectors which coexpress two genes from separate promoters, the **pac** gene which confers resistance to puromycin and a **baculovirus** gene which inhibits apoptosis, derived from *Orygia pseudotsugata* ***nuclear*** ***polyhedrosis*** virus. Both genes
